Category Map

There are **THREE** distinct categories here. GuardSpine is in governance, not code review.

GOVERNANCE / COMPLIANCE	CODE REVIEW / QUALITY	DEV PRODUCTIVITY
Vanta -- audit evidence	Greptile -- code search	LinearB -- eng metrics
Drata -- framework mapping	CodeRabbit -- PR suggestions	Jellyfish -- planning
GUARDSPINE -- AI artifact governance	Codacy -- static analysis	
Holistic AI -- AI risk management		

Vanta/Drata automate SOC 2 and ISO 27001 evidence collection for auditors. Greptile/CodeRabbit suggest code improvements on pull requests. GuardSpine governs what AI-generated artifacts are allowed into production, with cryptographic proof that the governance actually happened. These are not the same problem.

Why GuardSpine Wins

Open-core + BYOK = ~98% gross margins. Vanta and Drata run inference on their own infrastructure. GuardSpine customers bring their own model keys. We route, orchestrate, and sign -- we do not pay per token. Structurally different cost model.

Tamper-proof judgment receipts. Every governance decision produces a signed JSON bundle: model identity, prompt hash, response hash, consensus vote, timestamp. No other compliance platform produces cryptographic proof of AI governance decisions.

AI-native from day one. Vanta and Drata were built to prove humans configured AWS correctly. GuardSpine was built to prove AI models made safe decisions. EU AI Act (Aug 2026), NIST AI RMF, and ISO 42001 require exactly this -- incumbents are bolting it on, not building it in.

Works where incumbents do not. Offline/airgap (Ollama), GitLab, GitHub Enterprise, self-hosted. Vanta requires cloud integrations. GuardSpine runs as a single GitHub Action or GitLab CI job with zero infrastructure.

The Gap

Nobody in the market produces tamper-proof governance for AI-generated artifacts with a cryptographic proof chain.

Vanta and Drata prove your firewall is on. CrowdStrike proves it stopped a threat. Neither proves that the AI model that wrote your code, reviewed your PR, or generated your infrastructure config was actually governed before the artifact reached production.

That is the gap. The EU AI Act makes it a legal requirement by August 2026. Over 1,100 AI-related bills were introduced across U.S. states in 2025. The market for this does not exist yet -- GuardSpine is building it.

GRC market: \$49-63B (2024), 13-16% CAGR. AI governance sub-segment growing faster.
